Dear Recruiter,

As soon as I saw your posting for Software Engineer, I knew it was the perfect position for me – and that I was the perfect candidate for you. Let me explain further:

At my last internship at Western Digital, I was responsible for building a developer tool for visualizing P-values for various hard disk components. , hence, gained hands-on experience in automating various processes and I had many opportunities to learn about development operations while working as a Software Engineer. I am interested in this role because I believe that with my strong interest in software development I would be a valuable team member. For instance, I am currently working on a project where I am responsible for implementing an end-to-end web application using Django (Python), Javascript, and MySQL (github.com/moneysingh1991). Outside school, I am engaged in side projects so I can continue to learn new skills and keep up with rapidly changing technology. I am proficient in Java (Android), C++, Python (Numpy), and JavaScript, SQL, and I do not shy away from learning new skills and languages. Hence, with my past work experience and my technical skills and my willingness to learn new skills I will be valuable member in your team at your company.

I'm looking for a position where my contributions count and my efforts are appreciated. I hope I was able to explain why I am applying for this position and I hope to hear from you soon. In the meantime, should you have any concerns feel free to reach me out on my cell phone or email.

Sincerely,
Maninderpal Singh
